

IN THE SPECIFICATION:

Amend the paragraph beginning on page 6, line 12 as follows:

The above noted applications generally describe a cleaning attachment which includes a cover having a wipe detachably mounted to the bottom portion of the cover when the cover is mounted around the cleaning head of a cleaning implement. Figures 1-4 show a variation of the invention wherein the attachment 10 is actually a combination wipe and attachment. As shown therein attachment 10 is in the form of a flexible cover. Figure 1 illustrates the cover in its flat unassembled condition to have a first end 12 and a second end 14 interconnected by a continuous intermediate section 16. The second end 14 is bifurcated to create a pair of spaced outwardly extending flaps 18, 18 with an open space 20 between the flaps. Thus, as illustrated in Figure 1 the second end 14 terminates in a U-shaped outer edge to create the flaps which are spaced apart and out of contact with each other. The cover has an

Amend the paragraph beginning on page 8, line 12 as follows:

While the invention may be practiced where the entire cover is made of an absorbent material the invention may also be practiced where in addition to or instead of having the cover

made entirely of absorbent material only a section or multiple sections could be made absorbent. Preferably, the invention would be practiced wherein there is a contact portion 17 on one side of the loop adjacent to or in the general location of the central section 22. The intermediate section 16 could have a second contact portion 17 on the opposite side of the loop in the vicinity of the central section. Both contact portions 17,17 could be made of absorbent material so that there is a cleaning area on each side of the loop at the bottom of the loop. As a result, one of the

Amend the paragraph beginning on page 13, line 19 as follows:

Figure 9 illustrates a variation of the form of side attachment which is illustrated in Figure 4. As shown in Figure 9 instead of having bands or straps 38 secure the side edges of the cover together, the fastening structure could take other forms such as hooks and loops 50. The sets of fastening structure 50,50 on the two opposite side edges of the cover may be considered as supplemental fastening structure to secure the side edges together when the loop is formed.
